

## Academic study reveals serious issues with Isle of Man's anti-money laundering ratings

Findings in a leading peer-reviewed journal calls into question the most important component of the evaluation of the Isle of Man's anti-money laundering regime, updated on 7 September 2018.

The latest partial re-rating of the IoM's AML/CFT regime updates only 8 of 40 'technical compliance' measures. The European money laundering watchdog MONEYVAL didn't re-assess 11 'effectiveness' measures which the Paris-based Financial Action Task Force regards the "[main component](#)" of AML/CFT evaluations.

The Isle of Man's international reputation therefore remains tarnished by its 2016 'effectiveness' ratings, with lowly 'moderate' scores on 6 measures, the lowest possible ratings for 3, and no 'high' scores.

Moreover, new research published in the *Journal of Money Laundering Control* finds the new global 'effectiveness' methodology doesn't properly evaluate the effectiveness of AML/CFT regimes.

### New criteria seek to assess effectiveness

The Paris-based Financial Action Task Force introduced a new 'effectiveness' methodology in 2013 because compliance with FATF's "40 recommendations" (previously the sole focus of evaluations since 1990) gave no assurance that money laundering regulations were effective.

An extensive process demanding significant resources and preparation by authorities, evaluations now assess anti-money laundering regimes based on two sets of rules: technical compliance with FATF's 40 recommendations, and 'effectiveness' based on 11 'outcome' measures. But the new study reveals major flaws with the effectiveness criteria.

### Measuring effort, not outcomes

According to the study's author, Dr Ron Pol from international consultancy AMLassurance.com, "misapplication of *outcome* labels for what are, in truth, simplistic *output* and *activity* measures miss an opportunity to evaluate the real impact of anti-money laundering rules."

He says that FATF's new methodology doesn't evaluate outcomes in the sense generally understood as the *effect or impact* of regulations.

"More meaningful outcome measures, for example, might include the extent to which the system better allows authorities to reduce and prevent crime, and to cut the social and economic harms caused by serious crime like drugs-trafficking, corruption, fraud and tax evasion."

"Some of those measures are difficult to evaluate" says Pol, "but assessing anti-money laundering

regimes by superficial 'easy-to-measure' metrics suggests that the intensive rating exercise conveys value more as a rhetorical device than any real measure of effectiveness."

"That's because the current measures largely reflect the efforts of regulatory and enforcement authorities, not whether those efforts have any meaningful impact on serious crime."

### 'Tick-box' compliance extended

"Moreover", adds Pol, "assessors often use the same evidence to assess both the old and new criteria. But, compressing FATF's 40 recommendations into an abbreviated yet broadly equivalent list of so-called 'outcomes' adds little new evaluative capability beyond 11 more boxes to tick."

"The nature of any tick-box system means that it's possible for jurisdictions to get high ratings without much impact on crime, and vice versa" says Pol. "To their credit, Manx authorities appear often to have focused more on crime prevention than better ratings, although close examination of more than 50 evaluations to date reveal ways to achieve both. Nonetheless, although the new ratings system arguably lacks much meaning, low scores have a very real impact on any jurisdiction's access to financial markets."

### Effectiveness gap evidence mounting

Another academic paper also notes "enormous" frustration that, despite nearly 30 years of money laundering obligations (now imposed on millions of firms in nearly 200 countries) the "huge and growing cost of compliance has been accompanied by little observable effect". Professors Levi, Reuter and Halliday say that the modern anti-money laundering system is "highly cost-inefficient" and has failed "to produce credible evidence of [its] effectiveness."

The new study's detailed analysis makes similar findings. It concludes that FATF's new methodology offers few reliable indicators about the effectiveness of money laundering controls.

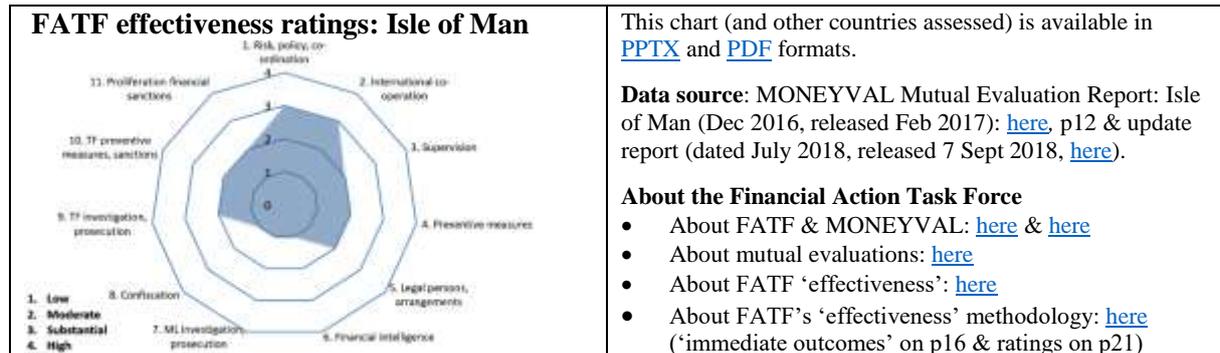

### Positive signs

But the new study ends optimistically. "FATF's frank acknowledgement that evaluating for effectiveness was missing, and important, is a positive step", says Pol. "Likewise, that outcomes matter. FATF also frequently adjusts its standards and guidance as circumstances change. If it accepts that some principles and practices underpinning its effectiveness framework might be improved, that tradition might reasonably be expected to continue."

## Notes for editor

### Supplementary material

The new study used ‘immediate outcome 7’ (money laundering investigations and prosecutions) to illustrate differences between *outputs* and *outcomes*, and why it matters.

In 2016, assessors noted that the Financial Crime Unit of the IoM Constabulary was “engaged mainly on domestic predicate crime that generates the highest proportion of domestic proceeds” and tends to be more reactive than proactive investigating cases where the predicate crime occurred overseas. Assessors said that the FCU did not regularly conduct parallel financial investigations alongside prosecutions for predicate offences (mainly drugs offences), even though they also observed that money laundering convictions sometimes increased the complexity of cases without adding much if anything to the length of sentences. Assessors said that the number of money laundering investigations “remains rather low” and rated the IoM’s ‘effectiveness’ in this area ‘low’; the lowest score.

More money laundering prosecutions would clearly help boost the IoM’s ‘effectiveness’ rating. “But,”

says Pol, “more money laundering prosecutions (an *activity* or *output* measure) might, or might not, help achieve the (crime prevention) *outcomes* that authorities seek.”

He gave a hypothetical example where enforcement agencies detect and prosecute twice as much serious crime but, with prosecutors overwhelmed, and consistent with IoM’s focus on the underlying crime, no money laundering charges are laid.

Authorities would of course promote their doubling of crime detection to positively influence ratings, but with no money laundering cases, the Isle of Man’s FATF ‘effectiveness’ score on this measure might conceivably remain low.

“Bizarrely”, says Pol “the prospect of the lowest possible rating if authorities successfully disrupt significantly *more* serious crime is an unintended consequence of focusing on simple output measures rather than crime prevention outcomes. Presumably, that would not be the intention of Manx authorities, or FATF.”
