

Research reveals serious issues with Sri Lanka's AML/CFT ratings

Sri Lanka's anti-money laundering regime has been upgraded on 'technical compliance' ratings. But the country's reputation remains tarnished by unchanged 'effectiveness' ratings with 'major flaws', according to independent research.

The latest re-rating of Sri Lanka's AML/CFT regime, released on 20 September, updated 6 of 40 'technical compliance' ratings. Asia-Pacific money laundering watchdog APG said that Sri Lankan authorities "made progress" addressing "technical compliance deficiencies", but didn't upgrade any of the 11 'effectiveness' measures which Paris-based Financial Action Task Force regards the "[main component](#)" of anti-money laundering evaluations.

This means that Sri Lanka's reputation and access to financial markets continues to be affected by its 'effectiveness' ratings from 2015, which the latest research published in the *Journal of Money Laundering Control* finds doesn't properly evaluate effectiveness. (Sri Lanka was awarded no 'high' ratings, a lowly 'moderate' score on one measure, and the lowest possible score for 9 of 11 'effectiveness' ratings).

New criteria seek to assess effectiveness

FATF introduced a new 'effectiveness' methodology in 2013 because compliance with its "40 recommendations" (previously the sole focus of evaluations since 1990) gave no assurance that money laundering regulations were effective.

An extensive process demanding significant resources and preparation by authorities, evaluations now assess anti-money laundering regimes based on two sets of rules: technical compliance with FATF's 40 recommendations, and 'effectiveness' based on 11 'outcome' measures. But the new study reveals major flaws with the effectiveness criteria.

Measuring effort, not outcomes

According to the study's author, Dr Ron Pol from international consultancy AMLassurance.com, "misapplication of *outcome* labels for what are, in truth, simplistic *output* and *activity* measures miss an opportunity to evaluate the real impact of anti-money laundering rules."

He says that FATF's new methodology doesn't evaluate outcomes in the sense generally understood as the *effect* or *impact* of regulations.

"More meaningful outcome measures, for example, might include the extent to which the system better allows authorities to reduce and prevent crime, and cut the social and economic harms caused by serious crime like drugs-trafficking, corruption, fraud and tax evasion."

"Some of those measures are difficult to evaluate" says Pol, "but assessing anti-money laundering regimes by superficial 'easy-to-measure' metrics suggests that the intensive rating exercise conveys value more as a rhetorical device than any real measure of effectiveness."

"That's because the current measures largely reflect the efforts of regulatory and enforcement authorities, not whether those efforts have any meaningful impact on serious crime."

'Tick-box' compliance extended

"Moreover", adds Pol, "assessors often use the same evidence to assess both the old and new criteria. But, compressing FATF's 40 recommendations into an abbreviated yet broadly equivalent list of so-called 'outcomes' adds little new evaluative capability beyond 11 more boxes to tick."

"The nature of any tick-box system means that it's possible for jurisdictions to get high ratings without much impact on crime, and vice versa" says Pol. "To their credit, authorities often appear to focus more on crime prevention than better ratings, although close examination of more than 50 evaluations to date reveal ways to achieve both. Nonetheless, although the new ratings system arguably lacks much meaning, low scores have a very real impact on any jurisdiction's access to financial markets."

Effectiveness gap evidence mounting

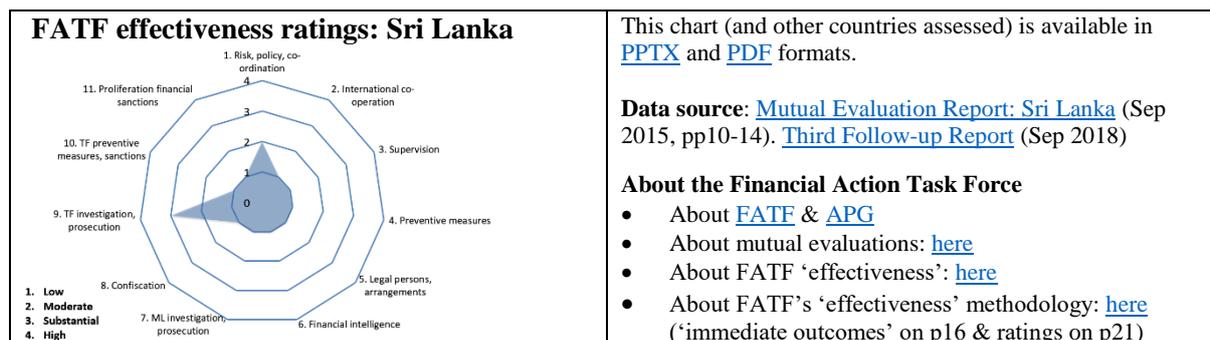

Another academic paper also notes "enormous" frustration that, despite nearly 30 years of money laundering obligations (now imposed on millions of firms in nearly 200 countries) the "huge and growing cost of compliance has been accompanied by little observable effect". Professors Levi, Reuter and Halliday say that the modern anti-money laundering system is "highly cost-inefficient" and has failed "to produce credible evidence of [its] effectiveness."

The new study's detailed analysis makes similar findings. It concludes that FATF's new methodology offers few reliable indicators about the effectiveness of money laundering controls.

Positive signs

But the new study ends optimistically. "FATF's frank acknowledgement that evaluating for effectiveness was missing, and important, is a positive step", says Pol. "Likewise, that outcomes matter. FATF also frequently adjusts its standards and guidance as circumstances change. If it accepts that some principles and practices underpinning its effectiveness framework might be improved, that tradition might reasonably be expected to continue."

Additional notes

Supplementary material: Sri Lanka

The new study used ‘immediate outcome 7’ (money laundering investigations and prosecutions) to illustrate differences between *outputs* and *outcomes*, and why it matters.

Assessors noted that Sri Lankan authorities “view the punishment of the predicate offence as sufficient deterrence and sanction”, without adding money laundering charges. Authorities told assessors that they seek to “disrupt criminals from benefitting from illicit proceeds by prosecuting the predicate offence...regardless whether it is possible or not to achieve a money laundering conviction.” The assessors, however, decried “low prosecution and conviction rates for money laundering” as evidence of what they regard an “overemphasis on prosecuting the predicate offence.” With “only one money laundering conviction to date” assessors claimed this illustrates “limited demonstration of effectiveness” and awarded the lowest possible rating on this measure.

More money laundering prosecutions would clearly help boost the country’s ‘effectiveness’ rating.

“But,” says Pol, “more money laundering prosecutions (an *activity* or *output* measure) might, or might not, help achieve the (crime prevention) *outcomes* that authorities seek.” He gave a hypothetical example where enforcement agencies detect and prosecute twice as much serious crime but, with prosecutors overwhelmed, and consistent with Sri Lanka’s focus on the underlying crime, no money laundering charges are laid.

Authorities would of course promote their doubling of crime detection to positively influence ratings, but with no money laundering cases, Sri Lanka’s FATF ‘effectiveness’ score on this measure might conceivably remain low.

“Bizarrely”, says Pol “the prospect of the lowest possible rating if authorities successfully disrupt significantly *more* serious crime is an unintended consequence of focusing on simple output measures rather than crime prevention outcomes. Presumably, that would not be the intention of Sri Lankan authorities, or FATF.”
